CHAPTER 1

splauncher

Motivation

This provides a simple tool for launching jobs using DRMAA. In particular, it launches the given command so that it starts in the current working directory, with the same environment variables, determines a job name derived from the command line call and time of launch, and finally automatically reroutes `stdout` and `stderr` to files named after the job.

Prerequisites

Installation and testing requires `setuptools`. Documentation relies on `sphinx`. Running relies upon proper installation and configuration of `drmaa-python`.

Installation

Assuming the proper prerequisites, installation can be done the standard python way (as seen below).

```
python setup.py install
```

CHAPTER 2

Indices and tables
